- Draw the structure of dichloro products for the monochlorination of (*R*)-2-chlorobutane, and clearly label the (*R*) or (*S*) for each of the chiral carbons. Point out the stereochemical relationship between the products as enantiomer, or diastereomer, if any. Is there any meso compound? (4%)
- Rank the following carbocations in decreasing order of stability, and give a brief explanation. (4%)

- The energy difference between the two chair conformations of *cis*-1,3-dimethylcyclohexane has been measured as about 5.4 kcal (23 kJ) per mole. (a) How much of this energy difference is due to the torsional energy of gauche relationships? (b) How much energy is due to the additional steric strain of the 1,3-diaxial interaction? (4%)
- Provide necessary reagents to complete each of the following multistep synthetic transformations. Show the structure of synthetic intermediate for each synthetic step. (20%)
