

八十四學年度 動力機械研究所 甲 組碩士班研究生入學考試

科目 熱流學(II) 科號 180 共 3 頁第 1 頁 \*請在試卷【答案卷】內作答

(1) Compressible Flow (15%)

For low-speed flow the stagnation pressure ( $P_0$ ) can be computed from Bernoulli's incompressible equation  $P_0 = P + \rho V^2/2$  ( $P$ : static pressure;  $\rho$ : density;  $V$ : velocity). For high-speed perfect-gas flow, the following equation ( $\gamma = c_p/c_v$ ;  $Ma$ : Mach number)

$$\frac{P_0}{P} = \left[ 1 + \frac{1}{2}(\gamma - 1)Ma^2 \right]^{\gamma/(\gamma-1)}$$

should be used. Verify that the above equation can be expanded into a series as follows (5%):

$$P_0 = P + \frac{1}{2}\rho V^2 \left( 1 + \frac{1}{4}Ma^2 + \frac{2-\gamma}{24}Ma^4 + \dots \right)$$

Suppose that a pitot tube measures the difference  $P_0 - P$  in subsonic flow ( $\gamma = 1.4$ ) and that the velocity is computed from the approximation  $V^2 = 2(P_0 - P)/\rho_0$ . At what Mach number will this calculation be in error by 2 percent? (10%) The relationship between  $\rho_0$  and  $\rho$  can be determined readily according to an isentropic process.

科目 熱流學(Ⅱ) 科號 1801 共 3 頁第 2 頁 \*請在試卷【答案卷】內作答

(2) Heat Conduction (20%)

The constant heat flux ( $q$ ) is applied to the both surfaces of a flat plate of thickness  $2L$ . The initial temperature of the plate is  $T_{\infty}$ .

Please give the formulation of the problem (10%) and find the unsteady temperature of the plate (10%).

(3) Radiation (15%)

Explain the greenhouse effect (15%).

(4) Potential Flow

Please explain the physical meanings of each term on the right hand side of the equation for stream function

$$\psi = U_{\infty} r \sin\theta - \frac{\lambda \sin\theta}{r} - K \ln r + \text{const}$$

If we choose  $\lambda = U_{\infty} a^2$  and let  $\text{const} = K \ln a$ , then the stream function becomes

$$\frac{\psi}{U_{\infty} a} = \sin\theta \left( \frac{r}{a} - \frac{1}{\frac{r}{a}} \right) - \left( \frac{K}{U_{\infty} a} \right) \ln \frac{r}{a}$$

Please draw the stream lines if the value of  $\frac{K}{U_{\infty} a}$  is

- (a) 0 (b) 1.0 (c) 2.0 (d) 3.0. (20%)

(5) Forced and Natural Convection

(a) Let  $x$  be the longitudinal distance from the leading edge. The critical Reynolds number based on  $x$ ,  $Re_c = Ux_c/\nu = 5 \times 10^5$  marking the laminar-turbulent transition. For a uniform air flow over a plane wall, what will be the range of the critical length  $x_c$  for the transition if  $U = 2-10$  m/s. (6%)

(b) Similarly, the critical Grashof number  $Gr_c = g\beta \Delta T x_c^3/\nu^2 = 10^9$  indicates the laminar-turbulent transition for a natural convection air flow near a heated vertical plate with a temperature difference  $\Delta T$  from the ambient temperature. Please give the range of the critical length  $x_c$  for the transition if  $\Delta T = 20-100$  K. (6%)

( $\nu = 0.15 \text{ cm}^2/\text{s}$ ,  $\alpha = 0.21 \text{ cm}^2/\text{s}$ , and  $g\beta/\nu\alpha = 107 \text{ cm}^{-3} \text{ K}^{-1}$ )

(6) Internal Convection

Starting with continuity, momentum and energy equations, please prove that the value of Nusselt number is  $Nu = 48/11$  for a hydrodynamically and thermally fully developed flow in a uniformly heated long circular pipe. (18%)
