1. (20%)

The initial state of a quantity of monatomic ideal gas is $P = 1$ atm, $V = 1$ liter and $T = 373$ K. The gas is isothermally expanded to a volume of 2 liters and is then cooled at constant pressure to the volume V . This volume is such that a reversible adiabatic compression to a pressure of 1 atm returns the system to its initial state.

(a) Assuming all of the changes of state are conducted reversibly, please calculate the value of V and the total work done in this cycle. Is this work done "ON" or "BY" the gas?

(b) If the change of state, either isothermal expansion, constant pressure cooling, or compression is not reversible, would V become larger or smaller?

2. (10%)

Calculate the change in enthalpy and the change in entropy when one mole of α -ZrO₂ is heated from 25°C to 1000°C.

3. (10%)

A reversible heat engine, operating in a cycle, withdraws heat from a high-temperature reservoir (the temperature of which consequently decreases), performs work w , and rejects heat into a low-temperature reservoir (the temperature of which consequently increases). The two reservoirs are, initially, at the temperatures T_1 and T_2 , and have constant heat capacities C_1 and C_2 respectively. Calculate the final temperature of the system and the maximum amount of work which can be obtained from the engine.

4. (15%)

Please describe the Henry's law for a binary A - B solution. Prove that in the range of composition over which the solute B obeys Henry's law, the solvent A obeys Raoult's law.

Joule and Thomson showed experimentally that when a steady stream of non-ideal gas is passed through a thermally insulated tube, in which is inserted a throttle valve, the temperature of the gas changes and the state of the gas is changed from P_1, T_1 to P_2, T_2 . Show that this process is isenthalpic.

You are responsible for the purchase of oxygen gas which, before use, will be stored at a pressure of 200 atm at 300 K in a cylindrical vessel of diameter 0.2 meters and height 2 meters.

Would you prefer that the gas behaves ideally or as a van der Waals gas? You have to state your reasons.

[The van der Waals constants for oxygen are $a = 1.36 \text{ liters}^2\text{-atm/mole}^2$ and $b = 0.0318 \text{ liter/mole}$.]

Determine the maximum pressure of water vapor in wet hydrogen at 1 atm pressure in which chromium can be heated without oxidation occurring at 1500 K. Is the oxidation of Cr by water vapor exothermic or endothermic?
