

# 國立清華大學 106 學年度碩士班考試入學試題

系所班組別：生命科學院丙組

考試科目（代碼）：計算機概論(演算法與計算機數學)(0704)

共\_\_2\_\_頁，第\_\_1\_\_頁 \*請在【答案卷】作答

1. (20%) Answer the following questions regarding binary trees.
  - 1-1. (4%) Given three elements A, B, C, list all possible binary trees.
  - 1-2. (6%) How many different binary trees exist for  $n$  elements?
  - 1-3. (10%) What are the defining properties of (1) heap and (2) priority queue? Discuss the time complexity for using heap versus priority queue to sort a list of elements.
2. (20%) Given a linked list  $L$ , answer the following questions.
  - 2-1. (6%) Design a procedure for printing  $L$  in its **reverse order** using a stack as a supporting storage. Present your answer with pseudocode.
  - 2-2. (6%) Is it possible to perform the same task without explicitly using a stack?  
If so, how? Present your answer with pseudocode.
  - 2-3. (8%) Discuss the time and space complexity of the two procedures that you presented above.
3. (35%) Answer the following questions regarding search.
  - 3-1. (6%) What letters are interrogated by the binary search algorithm if it is applied to the list A, B, C, D, E, F, G, H, I, J, K, L, M, N, O when searching for the value X?
  - 3-2. (6%) What's the best-case and worst-case time performance of binary search?
  - 3-3. (8%) Is binary search faster or slower than linear search? Why? What's the "secret", such as the idea or strategy, behind the one that's faster?
  - 3-4. (15%) What is the **average** number of comparisons used by the insertion sort to sort  $n$  distinct elements? Show the steps of derivation.  
  
*Hint:* Suppose that  $X$  is the random variable equal to the number of comparisons used by the insertion sort to sort a list  $a_1, a_2, \dots, a_n$  of  $n$  distinct elements. Then  $E(X)$  is the average number of comparisons used. Show how to derive  $E(X)$ .

共\_\_2\_\_頁，第\_\_2\_\_頁 \*請在【答案卷】作答

4. (25%) Answer the following questions about graphs.

4-1. (5% ) Define what is a spanning tree. Provide an example to illustrate your definition.

4-2. (10%) Define and explain what is a minimum spanning tree. Present a *greedy* algorithm that can construct a minimum spanning tree. Discuss why is it “greedy”.

4-3. (10%) Adjacency list and adjacency matrix are common representations of graphs. Compare them, and discuss the disadvantages and advantages respectively. *Hint*: Consider common operations of graphs, such as edge addition, deletion and traversal.
